

Date:2018/10/13

Patient's Name: Sh.R

Responsible Physician: Dr.Esfandbod

Patient presentation:

44 years, Female

Family History: negative

Right lung adenocarcinoma diagnosed by chronic cough workup in 2017. She had a local recurrence at the same lung and underwent right lower lobe lobectomy. The latter tumor was ER PR positive, HER2 positive, GATA positive, TTF negative

Question: Should we consider the first lung tumor as a metastasis of breast cancer?

Recommended tests:-No further test needed

Recommended plan: Chemotherapy (focused on lung, encompassing both cancers) + Tamoxifen
