

Date: 2018/10/20

Patient's Name: R.J

Responsible Physician: Dr. Kheradmand

Patient presentation:

52 years, Female, Negative family history

Presented with right breast metastatic (bone) infiltrating ductal carcinoma since 2011, which has been treated with chemotherapy followed by Tamoxifen. A nipple retracting mass was found in the left breast two months ago, core needle biopsy proved invasive ductal carcinoma.

Question: Which option is suggested surgery or chemotherapy?

Recommended tests:-Whole body bone scan

Recommended plan: Bilateral breast surgery should be discussed with the patient as an option?
