

Date: 2018/12/8

Patient's Name: P.M

Responsible Physician: Dr.Alipour

Patient presentation:

52 years female/ Family history -

Left breast: clinically T2N2 mass . Core needle biopsy:ER - PR- HER+ IDC, with synchronous liver metastasis.

She underwent chemotherapy and thereafter liver lesions disappeared in imaging (PET Scan) but her breast lesion and lymph nodes are still present

Question: What should we do for the primary site?

Recommended tests: no further test needed

Recommended plan: Continuation of systemic therapy
