

Date: 17 Aug 2019. 98/5/26.

Patient's Name: Z.R.

Responsible Physician: Dr. Maddah.

Patient Presentation:

-A 42 year old female with breast cancer underwent MRM with adjuvant chemoRT. She presented with supraclavicular LAP during adjuvant RT. FNA of LN was done and metastatic involvement was confirmed.

-The patient was presented to tumor board session and PET scan and MRI of the brachial plexus was recommended for determination of disease extent.

-PET scan showed increased uptake in cervical LNs (up to skull base) and mediastinal LN (aortopulmonic window).

Question: How the patient should be managed?

Recommended Plan: Regarding disease extent, systemic therapy is recommended.
