

Date: 9 Nov 2019. 98/8/18.

Patient's Name: K. R.

Responsible Physician: Dr. Esfandbod

Patient Presentation:

- A34 year old female known case of right breast angiosarcoma from two years ago
- Surgery: mastectomy
- Pathology: low grade angiosarcoma 2.5 cm
- Thoraco-abdominopelvic CT scan: normal
- Adjuvant treatment: chemotherapy, radiotherapy
- Follow up: left breast mass, 4.5 cm
- Pathology: angiosarcoma, very low mitosis
- Surgery: mastectomy
- Adjuvant treatment: radiotherapy without systemic therapy
- Thoraco-abdominopelvic CT scan: normal
- Follow up: after one year
- Bone scan: right sacroiliac lesion
- MRI: right sacroiliac lesion
- Thoraco-abdominopelvic CT scan: normal

Question: what is the next plan?

Recommended Plan: biopsy of bone lesion, genetic consultation, whole spine MRI, review of pathology, OR radiotherapy without biopsy in addition of target therapy and systemic therapy

Pelvic MRI of a patient with angiosarcoma, in favor of Iliac bone metastasis.
