

Date: 15 Feb 2019. 98/11/26.

Patient's Name: Gh. M.

Responsible Physician: Dr. Giti

Patient Presentation:

- A 38year old female, left breast mass in lactating period 2 years ago
- Excisional biopsy: Inflammation
- One year after a mass in the same place without inflammation
- Excisional biopsy: fibrosis and fibro-adenoma
- One year after: a mass in the same place in pregnancy
- Excisional biopsy: Invasive ductal carcinoma with medullary pattern, 5.5cm, grade III, no lympho-vascular invasion
- Immunohistochemistry: ER-, PR-, HER2-, Ki67 60-70%
- Breast MRI: left breast mass with satellite lesions and suspicious axillary lymph-adenopathy

Question: what is the next plan?

Recommended Plan: FNA of axillary lymph-node and then systemic therapy and then surgery
