

Date: 15 June 2019 . 98/3/25.

Patient's Name: KH.H.

Responsible Physician: Dr.Jalaeefar.

Patient Presentation:

-A 78 year old female with right nipple ulcer and right retroareolar breast mass presented two years ago, which biopsy report showed paget disease and IDC respectively.

-The patient received no treatments during this period and now has come to clinic again.

-Her metastatic work up is negative. Pathology review reported IDC+DCIS, ER+, PR+, HER2+, Ki67 25-30%. She has history of renal transplantation, taking immunosuppressor drugs; her cardiovascular risk assessment has been determined as high.

Question: Regarding patients conditions, Surgery or hormone therapy alone is recommended?

Recommended Plan: Surgery and adjuvant hormone therapy after that is recommended.
