

Date: 6 June 2019 . 98/4/15.

Patient's Name: M.N.

Responsible Physician: Dr.Miri.

Patient Presentation:

-A 28 year old female presented with hip and low back pain, and was diagnosed with locally advanced breast cancer(ER+, PR+, HER2+, Ki67 20-25%) with multiple bone metastases(lumbar spine, sacroiliac joints, and sternum). She was investigated and no other metastases was found.

-She received chemotherapy.

-Her new bone scan shows progression of bone lesions.

Question: Is local treatment of breast cancer is justified?

Recommended Plan: Regarding progression of disease, medical treatment is recommended.
