

**Date:** 29.05.2021; 1400.03.08

**Patient's Name:** M.M

**Responsible Physician:** Dr.Ebrahimi

**Patient presentation:** A 37 year-old woman with left breast DCIS

FH: + (BC in her brother)

MRI (1400/2): Few irregular lobular enhancing masses in left UOQ, few borderlines Ax LN

CNBx: IDC, G3, LVI -, ER & PR 100% strongly +, HER2 -, Ki67 80%,

MG: Left B6, right grouped microcalcification in right UIQ

VAC Bx: DCIS, intermediate grade

Bone scan: NL

Thoracoabdominoplevic CT: Normal

### Question:

What is next Dx plan? Treatment sequence?

Is undergoing bilateral mastectomy recommended for her regarding to her personal & family history?

### Recommendation:

1. There isn't any suspicious LAP in MR review.
2. Continue NAC.
3. Axillary LN FNA.
4. Bilateral mastectomy after NAC.
