Patient's Name: F.Gh

Responsible Physician: Dr.Miri

Patient presentation: A 41 year-old woman with left breast cancer and left breast suspicious mass about last year (3cm in left LIQ) who underwent bilateral MST & SLNBx & DTI reconstruction after NAC, then she experienced mastitis several times since last 8 months.

CNB: IDC, ER+,PR+,HER2 +, Ki67 70%

Axillary LN Bx: positive for malignancy

MR: No evidence of Recurrence

Question:

What is the next plan?

Recommendation:

1. US
2. F/U
3. Corticosteroid treatment could be helpful (Redness Syndrome)
