

**Date:** 19.06.2021; 1400.03.29

**Patient's Name:** M.Sh

**Responsible Physician:** Dr.Omranipour

**Patient presentation:** A 20 year old-pregnant woman with left breast erythema who underwent US guided CNBx Because of no response to Anti biotic therapy, then open skin bx for inflammatory breast cancer assessment.

PEx: skin erythema in periareolar(about 30% of breast skin)

US: Two mass in left UOQ, midzone, 3 o'clock (11mm & 12mm) & negative axillary LN

CNB: IDC, G1, ER+, PR+, HER2 -, Ki67 15-20%,

Skin Bx: negative

**Question:**

NAC plus BCS or mastectomy?

**Recommendation:**

1.NAC then mastectomy (inflammatory breast cancer).
