

Date: 07.08.2021; 1400.05.16

Patient's Name: N.R

Responsible Physician: Dr. Ebrahimi

Patient presentation:

A 23 year-old lady with a mass sensation in her left breast since 9 months ago.

FH:Grandmother

She has had consecutive imagings in which the tumors were increasing in size and numbers

Multiple CNBX & Pathological reviews done

Finally: T cell lymphoblastic Lymphoma of left breast

Her mediastinal massCNBx: Thymoma,lymphocyte rich Type(B2)

She has received 8 sessions of chemotherapy, but clinically has progressed in left breast (entirely occupied with interconnected masses) and also there is a new 60*35 mm mass in right breast which is identical to the left based on US her oncologist referred her to the surgeon.

Question:

What is the next plan?

Recommendation:

- 1.All salvage and both breasts XRT.
- 2.Pathology block review.
- 3.Allogenic BMT.
