

Date: 03.12.2022; 1401/09/12

Patient's Name: M.J

Responsible Physician: Dr.Omranipour

Patient presentation: A 78 year-old woman with history of HTN, DM and open heart surgery for 2 times (ASD in 1373 and CABG in 1383), with right breast mass.
CNB: 22*17mm mass in 5 o'clock, IDC, ER: 70%, PR: 30%, HER-2: negative, Ki67: 8%, axillary Lymph Node: positive.

CT scan of chest: Multiple lung nodules suspicious of metastasis.

Question:

- 1-Is lung lesion metastasis?
- 2-Is upfront surgery needed or NAC chemotherapy?

Recommended plan:

- 1- Follow up 6 months later because Lung lesion was small to characterize.
- 2- Upfront surgery after cardiology consultation.

Figure 1, multiple nodules (up to 6 mm) in both lungs

Figure 2, multiple nodules (up to 6 mm) in both lungs
